背景

Annexin VI belongs to a family of calcium-dependent membrane and phospholipid binding proteins. It is characterised by a conserved core domain which binds to phospholipids in a Ca²⁺ dependent manner and a unique amino terminal region which may confer binding specificity. The Annexin family has been implicated as regulators of such diverse processes as ion flux, endocytosis and exocytosis, and cellular adhesion. Annexin VI has been implicated in mediating the endosome aggregation and vesicle fusion in secreting epithelia during exocytosis.
